BISS C REGISTER ACCESS DETAILS

Structure of a single, complete SCD cycle

- The CDM bit is transmitted inverted with the MA clock.
- The CDS bit is the response of a slave and this response is transmitted to the master in the following cycle.
- Every SCD cycle ends with a BiSS timeout.

Structure of a starting single register access

- Minimum 14 SCD cycles with "CDM = 0" are required to abort a possible previously started command frame.
- "START = 1" indicates all slaves the start of a control communication.
- "CTS = 1" indicates all slaves a register access.
- CDS indicates with the "IDL" bits the master how many of the possible 8 BiSS IDs have been occupied.
- The "ID locking" informs every slave about its slave ID on the BiSS bus.
